

WORLD COUNCIL FOR HEALTH	
Product Recall For Safety	

2245 SC

When will these products be recalled - to ensure people's safety?

- 1 An international health and civil society organisation has reported that the Covid-19 vaccines need to be recalled immediately, on the basis of extremely concerning signals about the safety of the products.

The Covid-19 Vaccine Pharmacovigilance Report, prepared by the World Council for Health, has examined not only adverse events following Covid-19 vaccination - but also the rate of adverse events for other vaccines that has led to product recalls. The findings, which have now been shared with the media, make deeply disturbing reading.

- 2 The [Covid-19 Vaccine Pharmacovigilance Report](#), prepared by the World Council for Health - WCH - analyses pharmacovigilance data obtained from healthcare authorities and medicine regulators. Pharmacovigilance is a pharmaceutical science that is also known as drug safety.

Those healthcare authorities and medicine regulators holding the data - consisting of adverse event reports following vaccination that have been submitted by healthcare practitioners and patients - are:

The [World Health Organisation](#) [WHO], an agency of the United Nations responsible for international public health. The WHO provides advice to nations on pandemics - including the Covid-19 pandemic;

The [Centre for Disease Control and Prevention](#) [CDC], the USA's public health agency and a department of the US government, operating under the Department of Health and Human Services;

The [European Medicines Agency](#) [EMA], the European regulator of medicines and vaccines;

The [Medicines and Healthcare products Regulatory Agency](#) [MHRA], the regulator of medicines and vaccines in the UK. The MHRA, like the other regulators in other countries, is a government department.

The MHRA operates under the Department of Health and Social Care and is responsible for ensuring that medicines and medical devices work and are acceptably safe.

- 3 Shabnam Palesa Mohamed, a lawyer and member of the World Council for Health's steering committee, has [summarised the report's conclusions](#) as being that:

Adverse reactions for Covid-19 vaccines have been between ten and 169 times more common than for other vaccines.

There have been many non-fatal but serious adverse reactions.

More than 40,000 deaths are linked to the Covid-19 vaccines.

The evidence shows the need for a product recall.

Shabnam is quoted as saying:

"The purpose of pharmacovigilance databases is to provide a signal of safety, and not to prove causality."

"To ensure that harms are detected in time, suspicion that an event is linked to the administration of the medicine is enough to register an event."

- 4 The UK's MHRA has confirmed that a medical product should be recalled on the basis of suspicion, rather than proof. In 2006 the head of the MHRA, Dr June Raine, made this exact point in a BBC article [Drug reactions must be reported](#):

"There is no need to prove that the medicine caused the adverse reaction, just the suspicion is good enough."

- Dr June Raine, head of the MHRA

The BBC article said that, according to a British Medical Association [BMA] report in 2004, adverse reactions to medicines were significantly under-reported. The BMA's study found that 6.5% of people admitted to hospital had experienced an adverse drug reaction [ADR] and it was the cause for 80% of the admissions. 2% of patients admitted to hospital with an ADR died.

The head of Ethics and Science at the BMA, said doctors had a professional duty to report all adverse drug reactions, especially in children and the elderly, through the Yellow Card scheme. The BMA also urged pharmacists, dentists, nurses and coroners to report adverse events.

The BMA told doctors to be particularly vigilant in reporting reactions to new drugs, because:

"When a drug is first marketed, its effectiveness may be well understood but relatively little may be known about its safety in the population at large."

The Yellow Card Scheme, which is run by the regulator in the UK - the MHRA - was set up in 1964 after the [Thalidomide](#) tragedy, in which babies were

born with serious deformities because their pregnant mothers took a drug called Thalidomide.

- 5 The [World Council for Health's report](#) states that Phase 3 and 4 trials normally establish the safety and efficacy of pharmaceutical products. However, these trials are not complete for Covid-19 injections - the Covid-19 vaccines are still in Phase 3 trials - so their safety and efficacy have not yet been established.

The report also states that most of the people who have received these injections – which is now several billion people - are not being monitored by the clinical trials, which are still continuing.

In contrast to the Polio vaccine, which was recalled after 10 reported deaths and the Swine Flu Vaccine - recalled after 53 reported deaths - the Covid-19 vaccine, even after thousands more deaths, has NOT been recalled.

Further, there is concern about the decreasing efficacy of the Covid-19 injections - these products do not function like other similar vaccines and do not prevent people from contracting, spreading, or becoming ill with Covid.

As a side point, other, safer, products which are capable of reducing harm from the same illness, have been side-lined and totally discounted. People may wonder why.

The report's conclusion is that there is sufficient evidence in all the pharmacovigilance databases examined to establish a concerning safety signal about Covid-19 vaccines.

- 6 Given these findings, we would expect to see – as summarised by Shabnam Palesa Mohamed - administration of the Covid-19 vaccines being ceased, [the product recalled](#) and the safety concerns being investigated.

This *product recall* would take place in the same way that food products that *might be unsafe for some consumers* are recalled. One recent such product recall has been, "Spread Up Hazelnut Choco", which contained nuts – the wrong kind of nuts – as reported in an Express article [SPAR recalls popular sweet treat due to undeclared ingredient - do not eat it](#), in which the Food Standards Agency issued a risk statement about the product being a possible health risk.

It appears, however, that the approach is different between food and the Covid-19 vaccines. Newsweek's article [Doctors Shrug Off Patients With Rare Vaccine Disorders, Delaying Treatment](#) is far from the only indication that the "best to be safe" policy is not being followed by all doctors.

In this particular article, the vaccine-damaged people are in the USA, but the issues they face – the severe difficulty in accessing medical treatment for debilitating symptoms that have begun after they had a Covid-19 vaccine – face people everywhere, including in the UK.

"We are not allowed to be heard in any way, shape or form" is a quote by one of the patients in the Newsweek article.

In the UK, one woman who after receiving her first Covid-19 vaccination experienced an adverse reaction - which continues to this day - [spoke at a recent conference](#). Her presentation stunned the audience and the other speakers! Caroline Pover explained how the medical profession has effectively shunned her and made it exceptionally difficult for her to receive the help she clearly needs. It is - as if - the profession does not wish to acknowledge or draw attention to the failures of their health policies.

Caroline has published a best-selling book – [Covid Vaccine Adverse Reaction Survival Guide](#) - to help other people cope with their own vaccine injuries. Her book is also available on [Amazon](#).

- 7 With all the above said, I will now pose two final questions:

If doctors are dismissive of patients' symptoms - and are dubious that a vaccine could have caused them - are those doctors likely to file reports to their medicines regulators, as they have a professional duty to do?

And – to keep everyone safe - when will there be a product recall of the Covid-19 vaccines?
